AUTHOR: Smozhenkov, N. F.

TITLE: On the Engraving of Original Maps

PERIODICAL: Geodeziya i kartografiya, 1959, Nr 10, pp 62-67 (USSR)

ABSTRACT: The author analyzes the disadvantages of engraving and outlines the prospects of this method on account of practical experience. He indicates the shortcomings of "Viniproz" which forms the basis of engraving, and points out that "Viniproz" needs further improvement. Engraving on glass is then discussed, and it is shown that the mechanical strength and durability of the engraving layer should also be further improved. The advantages and disadvantages of separate engraving of the individual map elements are then demonstrated. Practical experience has shown that the map elements should be engraved, the one after the other, on transparent material, wherefrom separate positives are obtained for every single element. The author then presents the technical method of preparing original maps for edition. Engraving is to be carried out on glass or a solid, permanently plastic material.

Card 1/2 Thus, cartographic production is largely rationalized. Further-

On the Engraving of Original Maps

TITLE: Some Possibilities of Reducing Manual Work in Carto-
graphic Production ³⁰

PERIODICAL: Geodeziya i kartografiya, 1960, No. 6, pp. 56 - 60

TEXT: The author discusses some problems connected with the improvement of mapmaking on the basis of his own experience. He recommends the use of map compilation as a model of separation drafting. On the basis of his experience, he points out that it is not necessary always to attach the inscriptions to the map compilation. The author gives recommendations for the use of projectors and the utilization of reliefs of an obsolete map. He gives advice for training draftsmen in a technique by which the map elements are compiled and entered in the final compilation at the same time. The author describes the method of simultaneous compiling and engraving of original maps. Finally, he describes the chemical method of engraving map elements worked out by himself and N. V. Goryachkin in 1959.

Original

Periodical: Sklar a keramik, 1956, Vol 6, No 7, 161-162; Czech

Abstract: A rapid method is described consisting in the titration of the sodium and potash with 1 N HCl, the addition of an excess of 1 N HCl, and boiling until the dolomite or limestone is completely dissolved, followed by back-titration with 1 N NaOH. A 10-g sample is used, and the titration is carried out to a methyl orange endpoint. The accuracy of the determination is $\pm 0.1\%$.

TITLE: Oxidation resistant steels for work in contact with molten glass

SOURCE: Sklar a keramik, no. 11, 1966, 319-323

TOPIC TAGS: nickel, chromium, iron, chromium steel, ~~chromium~~ nickel steel, nickel
chromium alloy, metal corrosion, molten glass, *corrosion rate, stainless steel,*
corrosion resistant steel

ABSTRACT: The corrosion behavior of iron, nickel, chromium, chromium stainless steels,
nickel-chromium stainless steels, and nickel-chromium alloys in molten glass at
1300C with an exposure time up to 15 hr has been investigated. The silica-base
glass contained 15.2% sodium oxide, 8.2% calcium oxide, 3.6% magnesium oxide, 0.8%
aluminum oxide, 0.39% sulfur trioxide, and 0.11% ferric oxide. Iron was found to
corrode at a linear rate; nickel at a parabolic rate, but only during the first
5 hr, after which not further weight loss was observed. Chromium corrosion first
followed a parabolic rate which, after the first 5 hr, changed to linear (see Fig. 1).
The sulfur content in iron and nickel specimens increased to 0.072 and 0.39%,
respectively, after respective exposures of 12 and 15 hr. The corrosion rate of

TOPIC TAGS: chromium ~~nickel-austenitic~~ steel, ~~chromium~~ stainless steel, nickel chromium alloy, ~~metal corrosion~~, molten glass, ~~induced corrosion~~ metal oxidation, glass, nickel steel, corrosion resistant steel

ABSTRACT: The behavior of a series of chromium and nickel-chromium stainless and oxidation-resistant steels and nickel chromium in molten glasses has been investigated. Theoretical analysis, review of the literature data, and experiments showed that at 1300C in the most widely used sodium oxide-calcium dioxide glass containing about 0.1% sulfur trioxide, nickel and iron corroded at a respective rate of 10 and 13 mm/year. The corrosion rate of chromium was still higher. This was true not only for pure metals, but also for the alloy components. A chromium steel with 29% chromium corroded at a rate of 20-30 mm/year; a nickel-base alloy containing 23% chromium corroded at a rate of 15 mm/year. Steels and alloys with carbon content over 0.2% are not recommended for parts working in contact with molten glass. Oxidation-resistant chromium-nickel steels 24-19 and 21-37 were found to be

Corrosion resistance of combinations of metals under atmospheric conditions prevailing in Czechoslovakia. K. Smrček. *Korose a ochrana materiálu* 3, 1-4 (1959).—Expts. carried out with combinations of the more important tech. metals in mountain, city, and industrial atms. show that electrochem. relations do not, in a decisive way, affect the corrosion behavior of individual metals in their combinations. A more important factor is the proper specific corrosion effect of the atm. on the metals. To observe successfully the corrosion effects of the macrocells, the Compton method of contact was used, consisting of one part of the macrocell being rod-shaped in the form of a spiral. The 2nd part was made into a flat spiral of the same diam. By winding the spiral on the rod tight, contact of both parts was effected, with large contact areas for comparatively small samples.

Where under exceptional conditions the different electrochem. character of both metals in the combination was encountered, the effective range of the macrocell was spatially highly limited. F. H. Lieben

Effect of pH of solutions on the corrosion of metals.
K. Smrček. *Koroze a ochrana materiálů* 3, 57-9(1959).—
Individual relations, pH vs. corrosion, of the different metals
are divided into 5 principal groups; Group I, metals which
are not attacked by solns. in the pH range of 1-14; Group
II, metals corrosion-resistant in the acid and neutral regions
but attacked in alk. regions; Group III, metals which are
affected the opposite to those in Group II; Group IV,
mostly the amphoteric metals, which are attacked in acid
and basic regions but are relatively corrosion-resistant in
neutral solns.; Group V, metals which are attacked con-
siderably in acid solns., to a smaller degree in neutral solns.,
and become quite corrosion-resistant in alk. regions. The
effect of some stimulators of corrosion on the change of rela-
tion and the effect of the relation between surface of the
metal samples and the vol. of the soln. are emphasized.
A small vol. of soln. compared with the surface of the tested
metal can distort the relation.

TITLE: Method of treating fine grain and dusty materials

SOURCE: Hutnicke listy, no. 4, 1965, 302

TOPIC TAGS: magnesium oxide, magnesium compound, chloride, homogenization, magnesium

ABSTRACT: The article is an abstract of Czechoslovak Patent Application No: Class 18a, 1/00, PV 1262-64, dated 5 March 1964. Use of a Mg binder for pelletizing and briquetting is described. A suitable Mg material is xylolite, known as a construction material. When the ingredients are mixed in a correct proportion, material sufficiently strong for many purposes is formed. The binder containing MgO and MgCl₂ in proportions of 6:1 to 1:1 is mixed, and then added to the treated material in a proportion of 2 to 40% by weight. The required amount of the binder varies according to the nature of the raw material. The mixture can be shaped by any commonly known method, such as pelletizing, briquetting, pressing, or extruding. The mixture must be homogenized, and suitably wetted before it is shaped. [JPRS]

Contribution to the Problematics of Formation of the Magnetic Characteristics in $\alpha\text{-Fe}_2\text{O}_3$ Upon Heating to Medium Temperatures"

Budapest, Acta Technica Academiae Scientiarum Hungaricae, Vol 54, No 1-2, 6 Jun 1966, pp 61-72.

Abstract: [German article] The possible formation of maghemite ($\gamma\text{-Fe}_2\text{O}_3$) by annealing in the $500^\circ - 800^\circ\text{C}$ temperature range was studied on samples of a specular hematite concentrate, an Indian hematite ore, and a synthetic Fe_2O_3 material. The formation of the new phase, exhibiting magnetic properties, was observed and the presence of bivalent iron was verified by analysis. It is most probable that magnetite is the sole carrier of the magnetic properties originating by the reducing action of sulfur liberated by the thermal dissociation of the sulfides present and possibly also by the action of carbon monoxide contained in the gaseous dissociation products of siderite heating. These assumptions were verified in the synthetic mixtures. Orig. art. has: 5 figures, 2 formulas and 3 tables. [JPRS: 36,867]

Title : Spontaneous Pneumothorax in Cattle.

Orig Pub : Veterinaria (Jugosl.), 1957, 6, No 2-3, 307-315.

Abstract : Spontaneous pneumothoraxes were investigated in 21 animals. In 3 of the cases the pneumothorax was bilateral. In all of the animals, such sponataneous pneumothorax was caused by a break-through of echinococcus cysts into the pleural cavity. Dyspnea predominated among the clinical symptoms. It increased with motion, and was accompanied by moans when exhaling took place. In some cases the thorax was asymmetric. Only in 2 of the animals was subdermal emphysema observed. The diagnosis of spontaneous pneumothorax was confirmed roentgenologically.

TITLE: Some questions in the general theory of a parametric amplifier with double pumping 63
B

SOURCE: Ref. zh. Fizika, Abs. 11Zh30

REF SOURCE: Tr. Nauchno-tekhn. konferentsii Leningr. elektrotekhn. in-ta svyazi, vyp. 1, 1964, 90-98 25

TOPIC TAGS: parametric amplifier, circuit theory, signal to noise ratio, receiver bandwidth, radar receiver, radiometer

ABSTRACT: The authors analyze a parametric amplifier with double pumping starting from the general premises of the theory of linear networks. An equivalent circuit of such an amplifier is presented as well as general expressions for the gain and the noise figure. It is indicated that the product of the gain by the bandwidth increases by several times compared with ordinary parametric amplifiers, with an insignificant deterioration of the noise properties, if the double-pumping parametric amplifier is intended for the reception of "radar signals," and can be increased appreciably if this double-pumping parametric amplifier is intended for the reception of radiometric signals. Yu. Romanovskiy. [Translation of abstract]

TITLE: A study of the protective properties of paint and varnish coatings at high temperatures and the effect of pigment type on the thermal degradation of the binder

SOURCE: Lakokrasochnyye materialy i ikh primeneniye, no. 3, 1965, 44-46

TOPIC TAGS: paint, varnish, corrosion prevention, alkyd resin, epoxy resin, thermooxidation, protective coating, thermal aging, film degradation

ABSTRACT: The purpose of this work was to study the corrosion resistance of paint and varnish coatings following thermal aging at 50-200C and to determine the effect of pigment type on the degradation of the films (pentaphthalic alkyd and alkyd, alkyd-melamine, and epoxy resins). It was found that the greatest damage to the films occurs during the first 50-100 hr. of exposure. Above 100C, the rate of degradation of the binder increases considerably. The porosity of the films increases after exposure to temperatures of 150 and 200C. A statistical treatment of the data showed that the influence of the pigment on the degradation of the film-forming material is very slight, and that temperature is the

TITLE: Forming of metals with a high degree of deformation.
Influence of explosive impacts on the mechanical
properties of metals

PERIODICAL: Hutnické listy, no.1, 1963, 74-75

TEXT: The report contains information and published relationships between the shock action of the force and its effect on the surrounding medium, and these relationships are applied to changes occurring during explosive forming. Literature published for military purposes on the destructive effect of explosions on bodies under water and the occurrence of failure in metals has been made use of. The report describes orientational tests carried out for the purpose of gaining initial experience of explosive forming and to determine the changes produced in the material by such forming. Research Report SVÚMT Z-61-1082.

TITLE: Production of epoxy resins

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 1, 1963, 539, abstract
1T130 (Czechosl. patent 100282, July 15, 1961)

TEXT: Epoxy resins are obtained when epihalohydrin and its derivatives react in the presence of a Friedel-Crafts catalyst with mono- and poly-atomic phenols, alcohols, bisphenols, or phenol resins, and the resultant mixture of halohydrin ethers of phenol compounds (or the mixture of separately prepared halohydrin ethers) and alcohol is dehydrohalogenated in high-alkaline medium. By way of example, 1 mole diene and 10 moles ethyl chlorohydrin are mixed in a flask and heated under stirring to 70°C. 1% triethanol amine (related to diene) and 3% NaCl in 15% aqueous solution are added. The mixture is heated to boiling and then left for 4 hrs. Then, 0.12 mole glycerin-tris-chlorohydrin ether is introduced, which has been prepared by reaction of 3 moles ethyl chlorohydrin and 1 mole

glycerin with BF_3 catalyst by heating to $65-75^\circ\text{C}$ for 3 hrs. To the mixture of chlorohydrin ethers, 2.56 moles NaOH in the form of 20% aqueous solution is added dropwise within 3 hr 45 min and left for 15 min. Then, 300 g benzene is added, the aqueous layer is separated and the resin solution is neutralized with CCl_4 to pH 6.5. The solution is dried with calcined soda and filtered, and the transparent filtrate is separated from the ethyl chlorohydrin excess by low-pressure distillation. "Some Notes on Ulcer Disease."

Prague, Časopis lékařů českých, Vol. 102, No. 11, 15 Mar 63, pp 281-287

Abstract [Authors' English summary modified]: The conclusion is reached that not every gastric or duodenal ulcer is a manifestation of corticovisceral ulcer. An increased emotional stress is not a precondition for the development of duodenal ulcer. Chronic appendicitis and perhaps appendectomy may be causative factors. Smoking enhances the development of ulcer. The metabolism of vitamin B-1 requires further study. The theoretical problems in gastric and duodenal ulcers may be quite different. Minute analysis of the case history and clinical findings call for individual methods of treatment. Fifty-four references, predominantly Soviet.

TITLE: Electromagnetic forming of metals

SOURCE: Strojirenstvi, v. 15, no. 3, 1965, 222-225

TOPIC TAGS: electromagnetic forming, copper sheet forming, iron sheet forming, aluminum sheet forming, metal sheet forming ^{10, 44, 55}

ABSTRACT: ^{10, 44, 55} Electromagnetic forming of metals has been investigated at the Department of Electrical Engineering of the Czech Polytechnic Institute in Prague. Blanks of aluminum (0.1, 0.3, and 0.5 mm thick), copper (0.5 mm thick), and iron (0.5 mm thick) were formed. The experiment showed that the depth of the cavity depends on the material formed and the amount of energy liberated. With an energy of 2500 Ws, the depth of cavity was 10 mm in an iron sheet 0.5 mm thick, 13 mm in a copper sheet 0.5 mm thick, and 29 mm in an aluminum sheet 0.3 mm thick.
